

# Sams Teach Yourself SQL In 10 Minutes

## 4<sup>th</sup> Edition

---

### Setup instructions for IBM DB2

1. Download and install DB2
2. Open Control Center
3. To create a new database, right-click on All Databases and select Create Database and then Standard, the Create New Schema button (it is the one that looks like a yellow barrel with a + sign next to it), this will launch the Create Database Wizard.
4. Set Database name to `tysql`, you can leave all the other fields blank and click Finish to create the database. (The create process could take some time).
5. Once created, you may right-click on the new TYSQL database and select Query to display a query window.
6. You can now type SQL in the editor window, but you must first make sure that your newly created database is selected. Look at the Target drop-down at the top of the screen. If something other than `tysql` is selected, change it.
7. Copy and paste contents of Create (may see warnings about keys, ok)
8. Execute button (Green arrow) to execute
9. Copy and paste contents if Populate
10. Test it with `SELECT * FROM Customers;`
11. Results displays in new tab, can switch back and forth between SQL and results.
